Module specification: template

English version of ../../modules/module-template.md.

Copy it to `docs/modules/<name>.md` and fill in all 11 sections — `make docs-check` verifies them in CI.

1. Purpose and boundaries

What it does, what it does not do, where its responsibility ends.

2. Use scenarios

User or system → what happens → what is observable, including failures.

3. Contract

HTTP routes, Socket.IO events, response schemas, error codes.

4. Data

Which SQLite files or tables the module writes (it is the only writer) and what it reads.

5. Access rules

Who has access; what happens on refusal; how it is verified.

6. Dependencies

Incoming (who calls it) and outgoing (whom it calls); the port to an external system.

7. Configuration

Environment variables with defaults and the consequences of a wrong value.

8. Build and debug

How to run just this module and how to reproduce the behaviour with a test.

9. Tests

Files and test names: what exactly is proven.

10. Observability

Logs, events, error codes, operator actions on failure.

11. Limitations and readiness

Known limitations, what was deliberately left out, readiness criteria.
