Monitoring

English version of ../../operations/monitoring.md.

Signal	Where	Purpose
`/health`	application	process state and both SQLite databases
Container HEALTHCHECK	`docker-compose.yml`, `Dockerfile`	restart on a hang
Logs	stdout, `app/logging_setup.py`	incident analysis, `LOG_LEVEL`
Socket.IO events	`app/realtime/*`	diagnosing rooms and rounds
Metrics	—	absent; this is a limitation, not an oversight

Minimal alerts

1. `/health` does not answer for 2 minutes or reports a database failure.
2. The container restarts more than once an hour.
3. The 5xx share is above 1% over 5 minutes.
4. GigaChat errors while a key is configured (AI degrades, the game keeps working).
5. A growing number of WebSocket disconnects — network problem or overload.

What is missing

- No `/metrics` and no dashboards.
- No distributed tracing.
- No SLO expressed as a number.
- Rooms live in process memory: a restart loses active games (visible in logs, but not measured).
