Verification matrix

English version of ../../verification/matrix.md.

Check	What it proves	Command	CI
Tests (190)	game rules, API, realtime, security	`make test`	`ci.yml` → `backend`
ruff	static rules are respected	`make lint`	`ci.yml` → `backend`
The app starts without AI	GigaChat is an option, not a requirement	start + `GET /health`	`ci.yml` → `backend`
Dependencies are pinned	a rebuild gives the same versions	`make install` from `requirements.lock.txt`	`ci.yml` → `backend`
The image builds and is healthy	the container starts and answers	`make build-image` + `/health`	`ci.yml` → `docker`
No secrets in the repository	keys do not leak through commits	`gitleaks`	`ci.yml` → `secrets`
`.env` is not tracked by git	the incident cannot repeat	`make doctor`	`ci.yml` → `secrets` + locally
Documentation is consistent	links are alive, module specifications are complete, every document has a translation and a PDF	`make docs-check`	`ci.yml` → `docs`
Compose fails without secrets	the production configuration cannot be empty	`docker compose config`	locally/manually
Smoke test of a live instance	the service answers after deployment	`make smoke-test`	manually after deploy

What is not checked automatically

- Several replicas: room state lives in process memory — the scenario is not supported rather than "not tested".
- Load and WebSocket stability with many players.
- The quality of questions generated by GigaChat.
- Restoring data from a backup: the procedure is described in database/storage.md but not automated (there is no database service that can be started in CI with one command).
